# 3 Important tips

- 1 Put the user in charge
- 2 Users can't read
- 3 Users can't use a mouse

# Put the user in charge

- Typing in your name before you type in your creditcard number should be as easy as doing it the other way around

# Put the user in charge

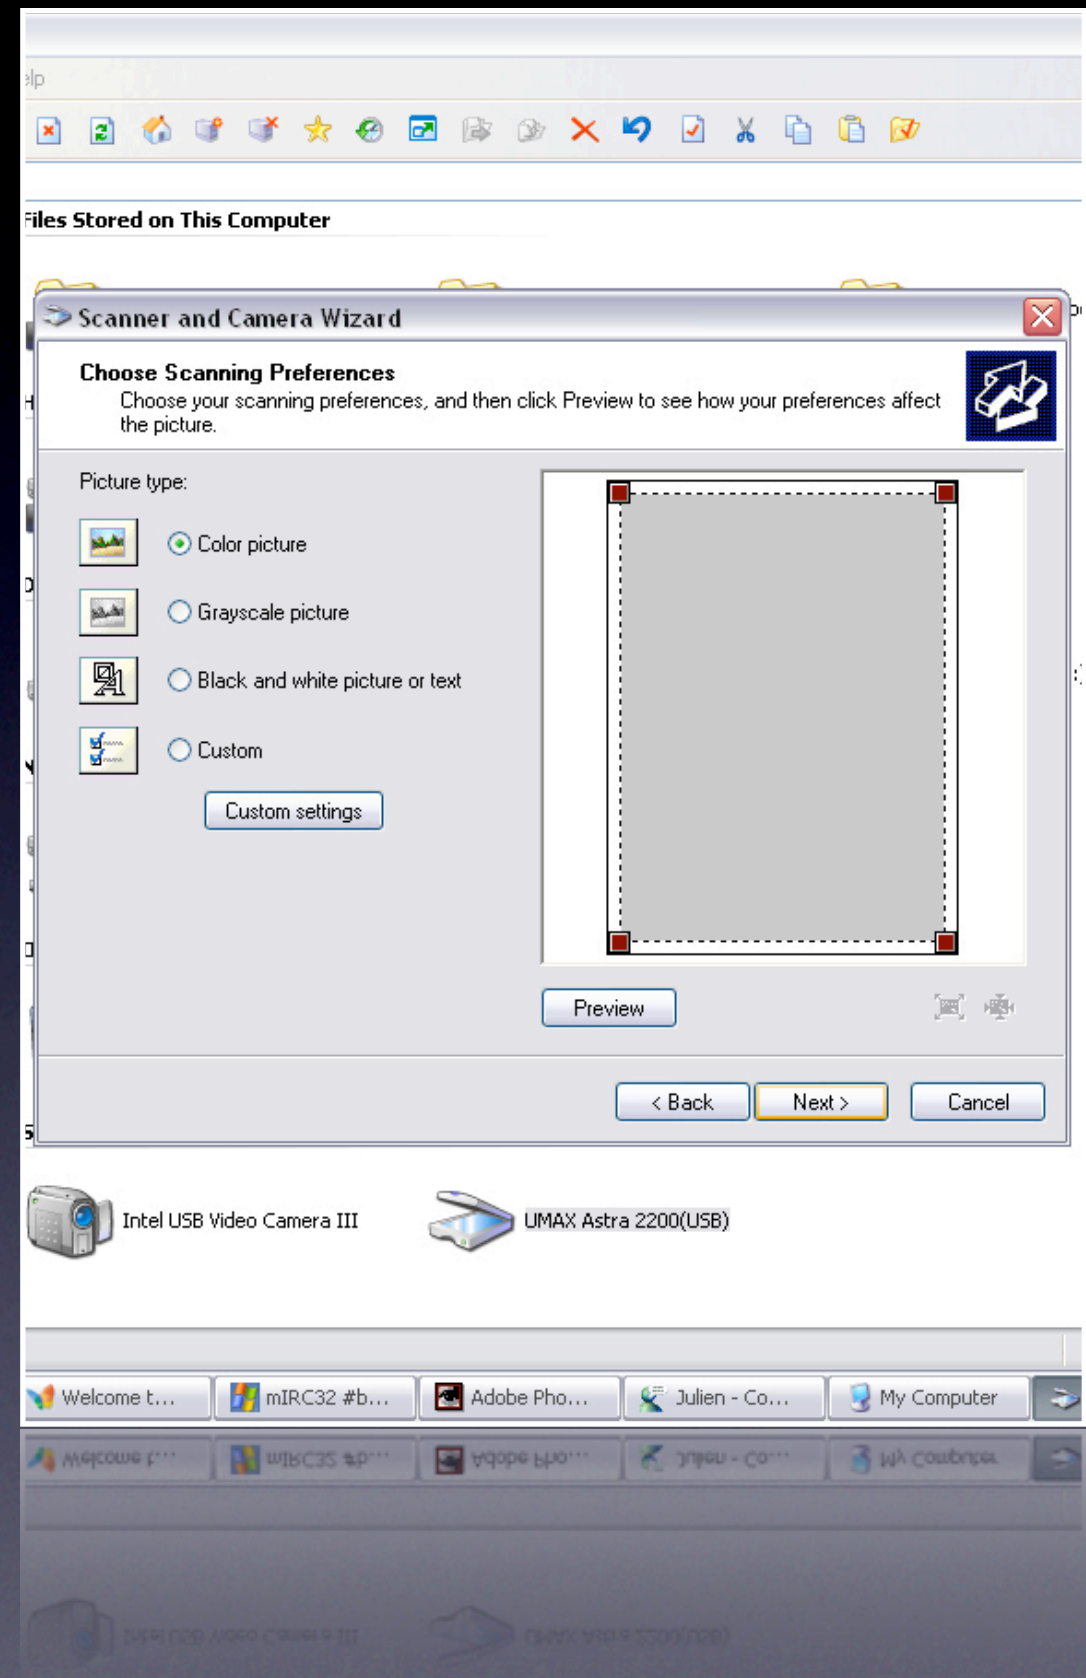

- Job as a designer: providing a well-stocked, well-equipped and well-lighted kitchen that the user can use to make his own masterpiece.

# Put the user in charge

Bad example:  
Taking the same step every time

You should be able to change  
setting just if you want

# Put the user in charge

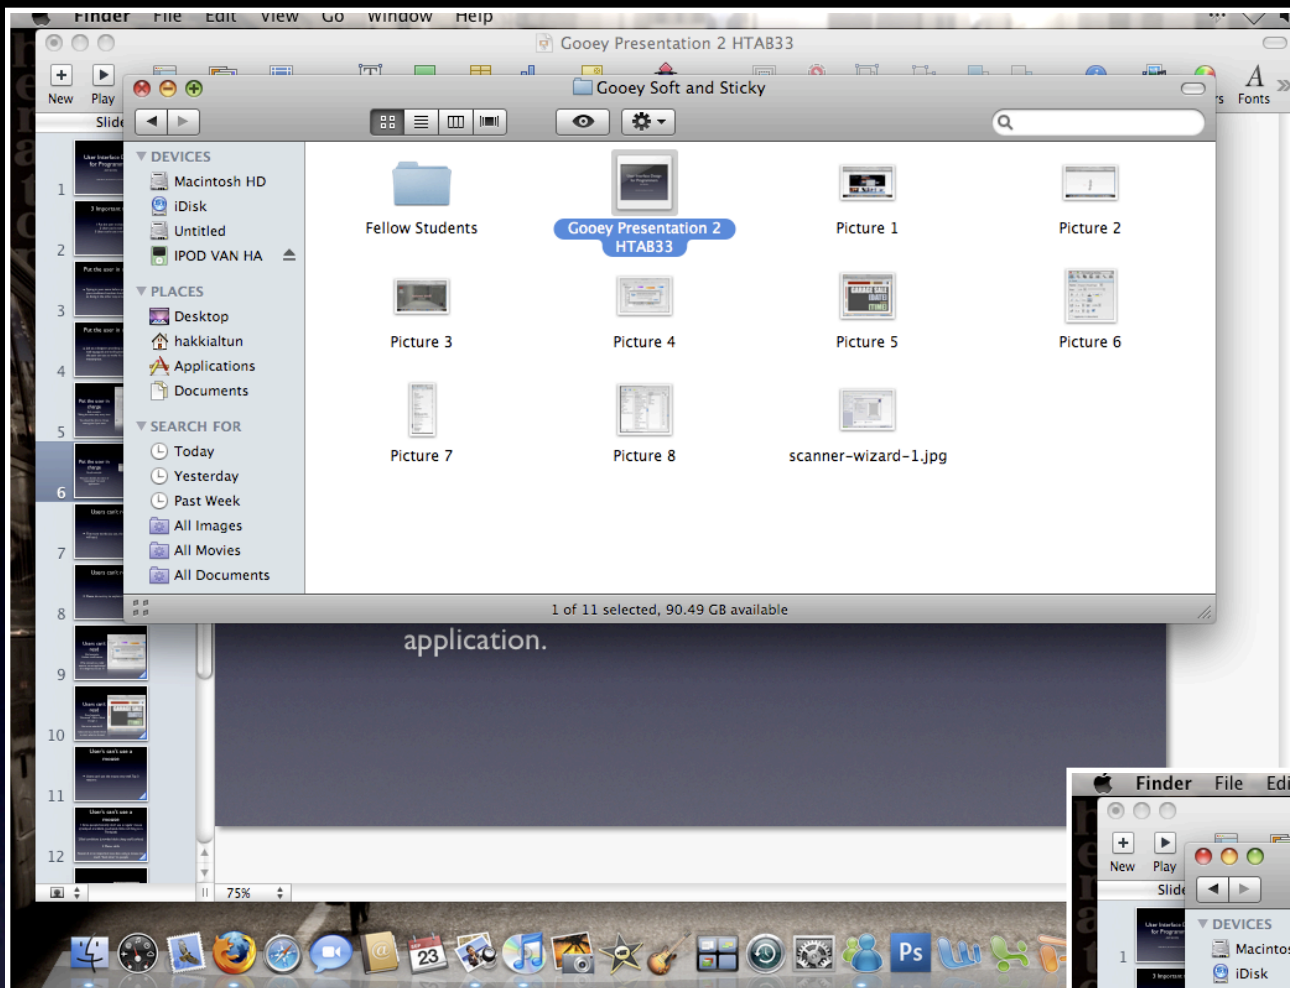

Good example:

The user decides the term of “maximized” for each application.

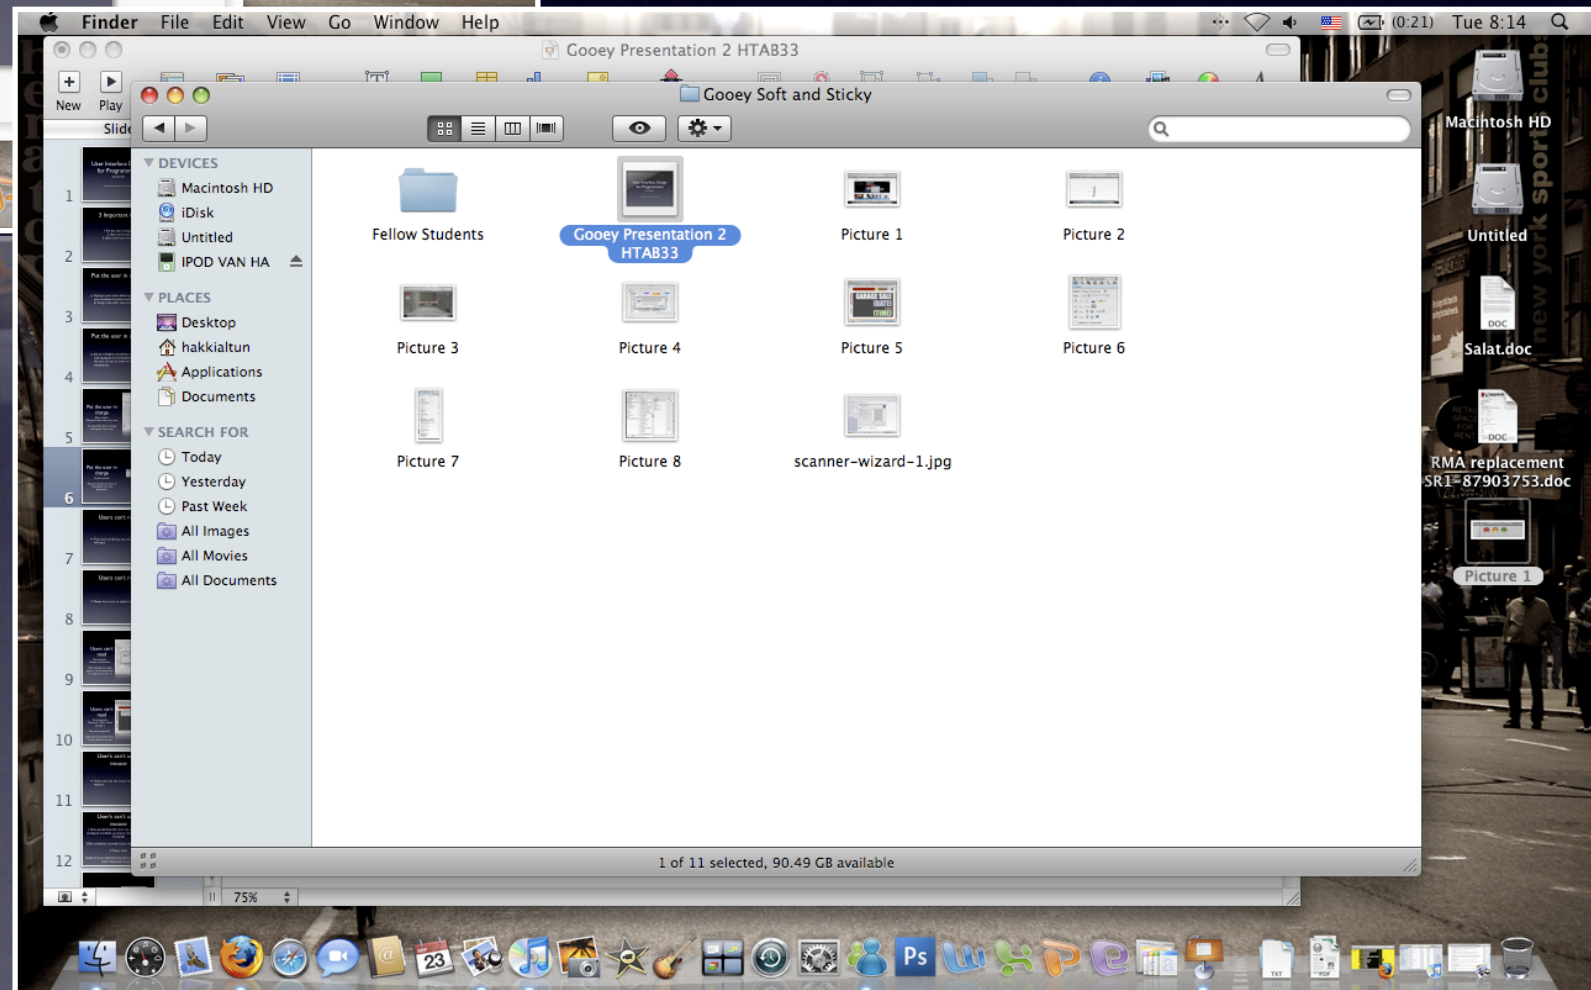

# Normal

# Maximized

# Users can't read

- The more words you use, the less users will read.

# Users can't read

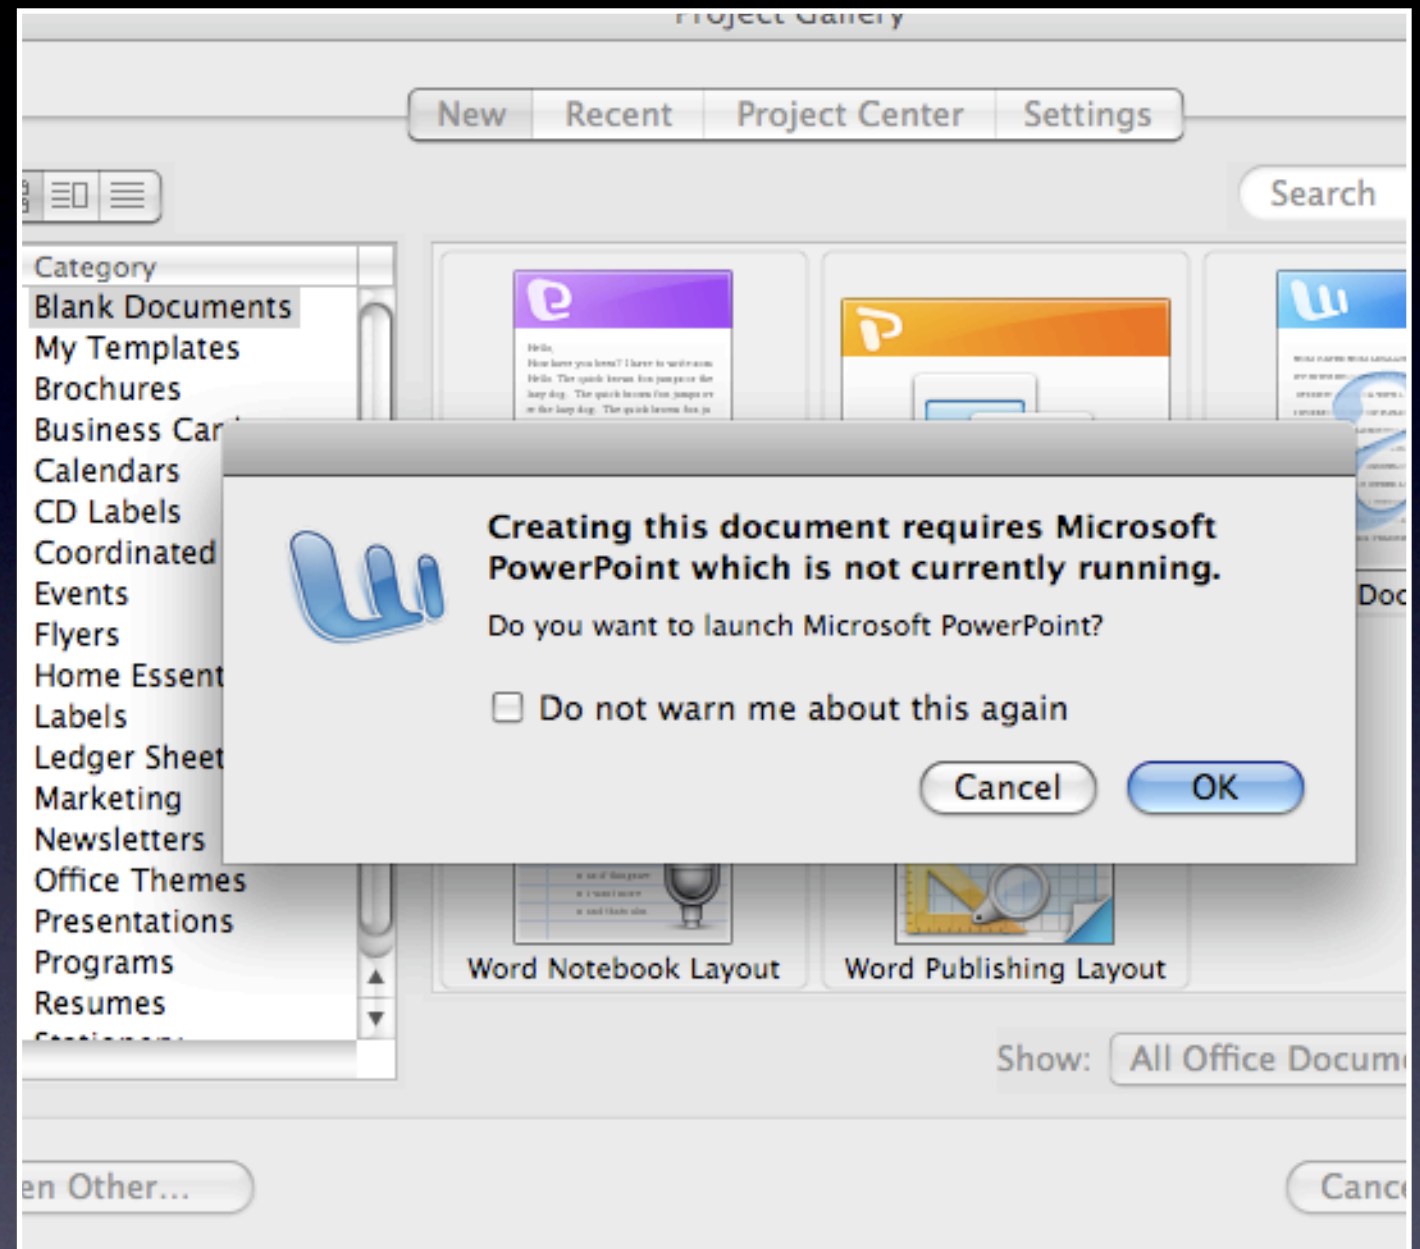

- Please do not try to explain things in words

# Users can't read

Bad example:  
Useless confirmation

Why asking if you really  
want to use an application?  
Is it dangerous to use ???

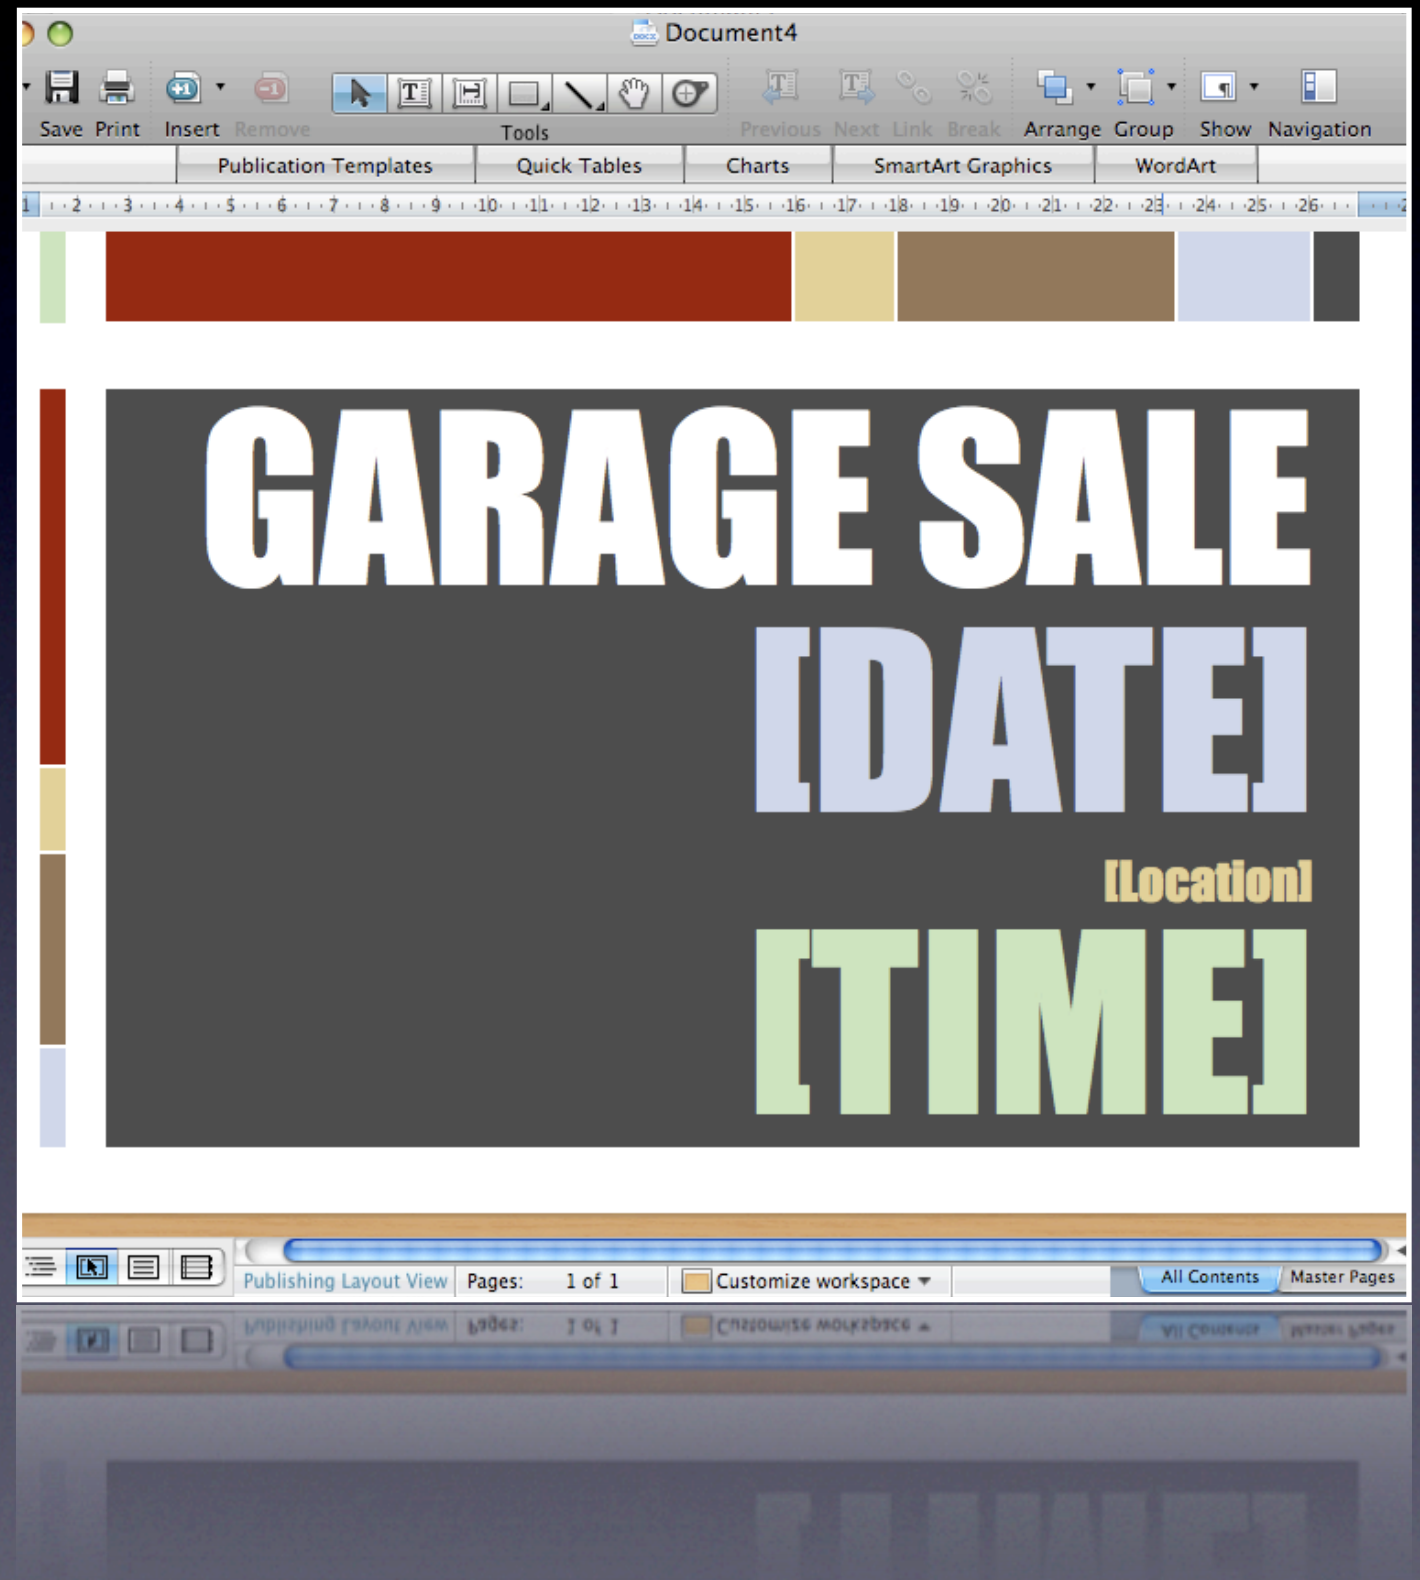

# Users can't read

Good example  
“Microsoft” Office Word  
though :)

No more wizards :D

Clear, and you decide where  
to start, what to do next

# User's can't use a mouse

- Users can't use the mouse very well. Top 3 reasons:

# User's can't use a mouse

1 Some people basically don't use a regular mouse (trackpad, trackballs, touchpads, little red thing on a Thinkpad)

2 Bad conditions (crowded desk, cheap stuff, surface)

3 Motor skills

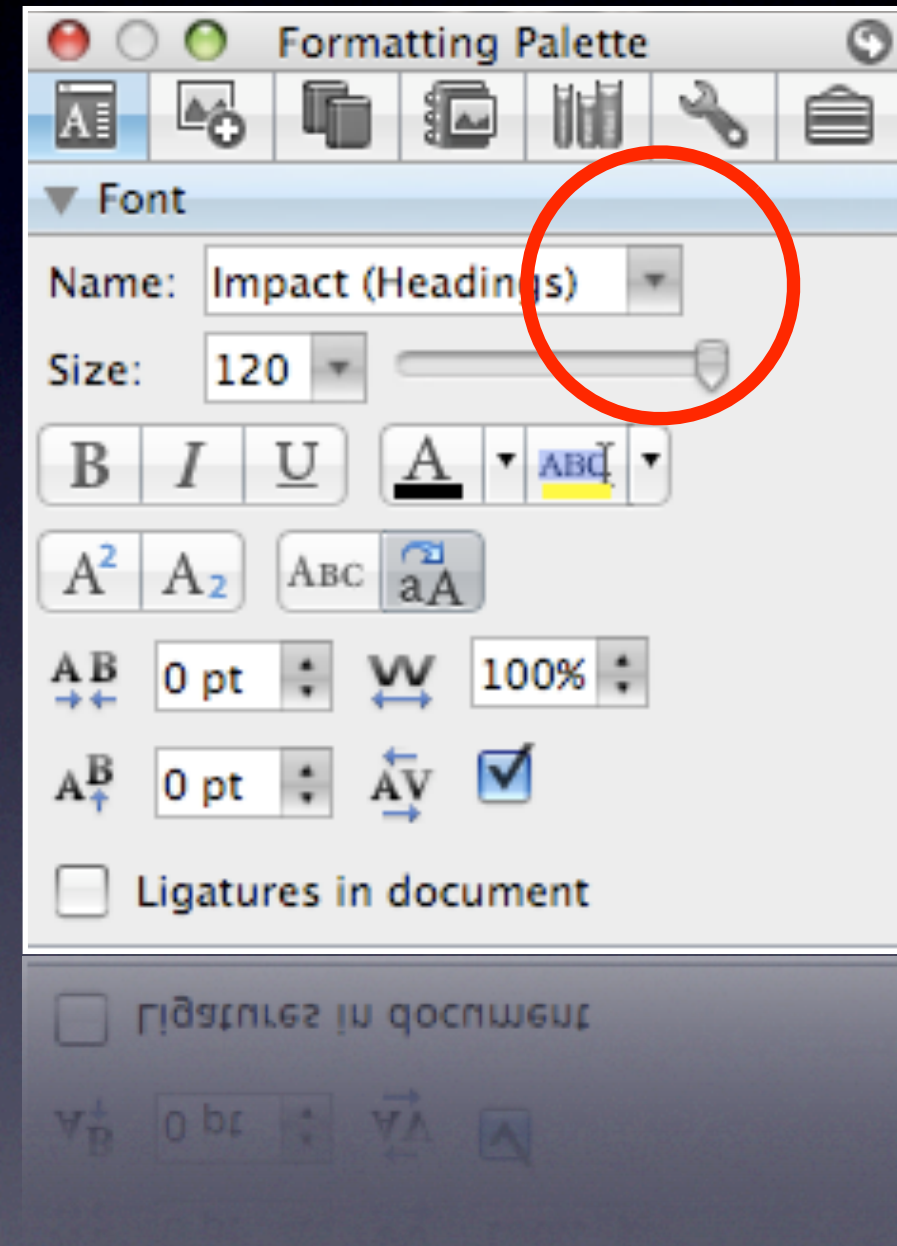

Reason 6 in an important one also: using a mouse too much "feels slow" to people

# Users can't use a mouse

Bad example:  
Exact pointing  
Small click space

Fast scrolling, no control of  
speed

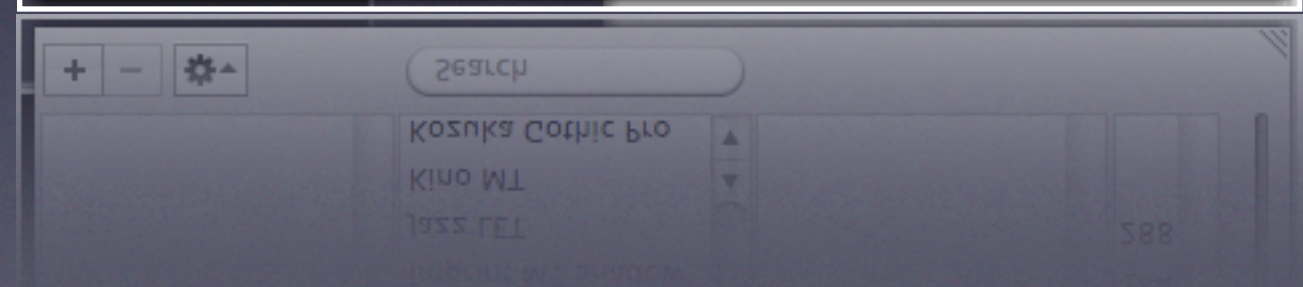

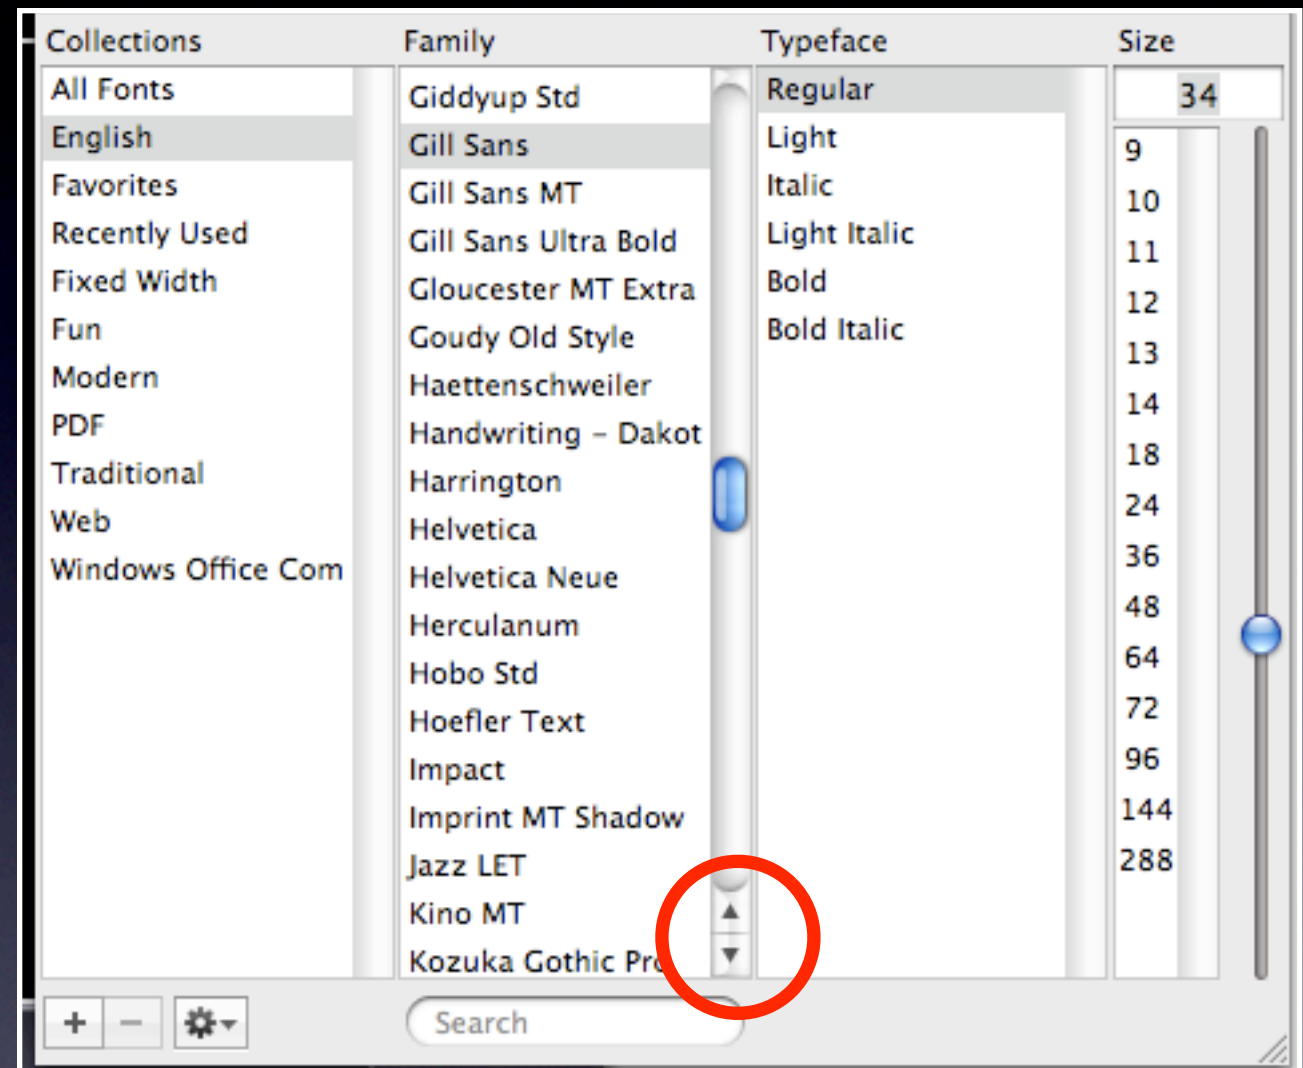

# Users can't use a mouse

Good example:  
No drop-down button for each  
function

Controllable scroll speed  
Up-down buttons together
