

Cellular Automata (part 2): Creative Applications

Notes for CAS, 18-5-2021

Loe Feijs

Cellular automata: research and applications

- Fundamentals of computation
 - ✓ Von Neumann, Conway, Wolfram
- Models of social behavior
 - ✓ Modeling language shifts
 - ✓ Land use change
 - ✓ Building evacuation
- Aesthetics and awareness in design
 - ✓ Lukas, Troy, Loe -> next time

Models of social behavior

- ✓ Beltran, F. S., Herrando, S., Estreder, V., Ferreres, D., Adell, M. A., & Ruiz-Soler, M. (2011). Social simulation based on cellular automata: Modeling language shifts. In Cellular Automata—Simplicity Behind Complexity (p. 323). InTech.
- ✓ Lu, Y., Laffan, S., Pettit, C., & Cao, M. (2020). Land use change simulation and analysis using a vector cellular automata (CA) model: A case study of Ipswich City, Queensland, Australia. *Environment and Planning B: Urban Analytics and City Science*, 47(9), 1605-1621.
- ✓ Ding, N., Chen, T., & Zhang, H. (2017, June). Simulation of high-rise building evacuation considering fatigue factor based on cellular automata: A case study in China. In *Building Simulation* (Vol. 10, No. 3, pp. 407-418). Tsinghua University Press.

Paper: Beltran, F. S., Herrando, S., Estreder, V., Ferreres, D., Adell, M. A., & Ruiz-Soler, M. (2011). Social simulation based on cellular automata: Modeling language shifts. In Cellular Automata—Simplicity Behind Complexity (p. 323). InTech.

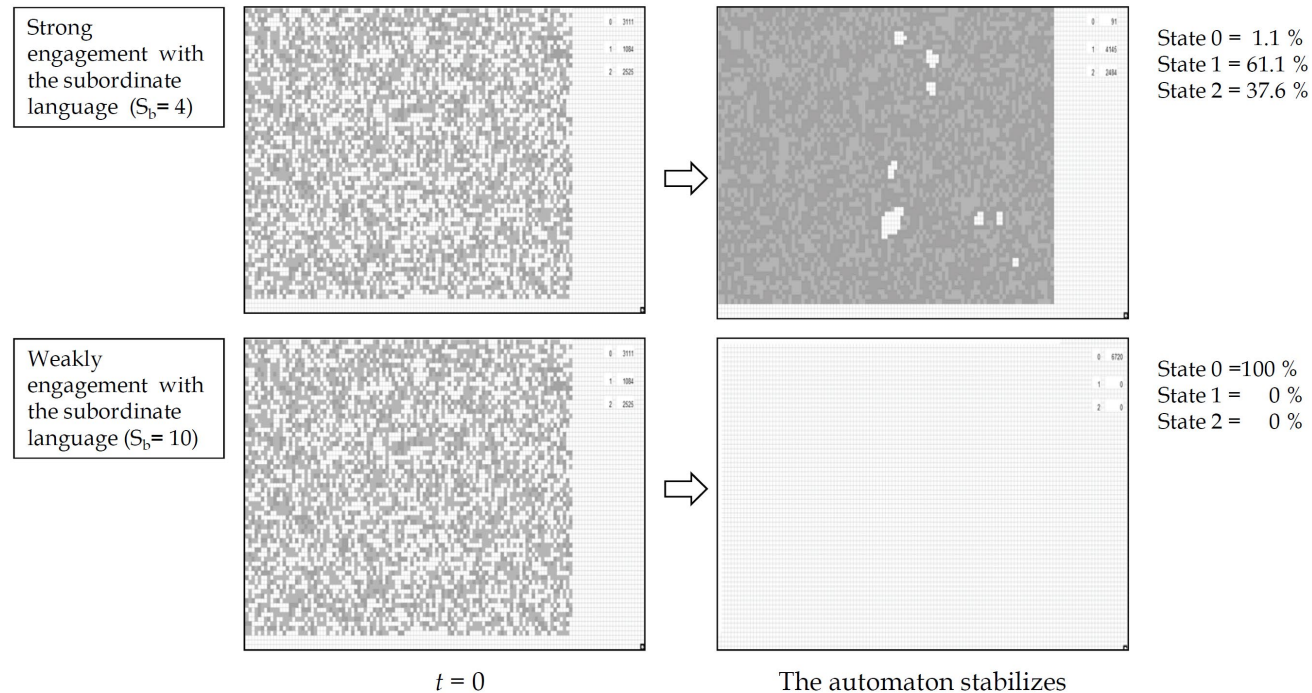

Fig. 4. An example of the dynamics of the cellular automaton that simulates language shifts.

Conclusions: the transition threshold S_b is critical. Catalan will survive.

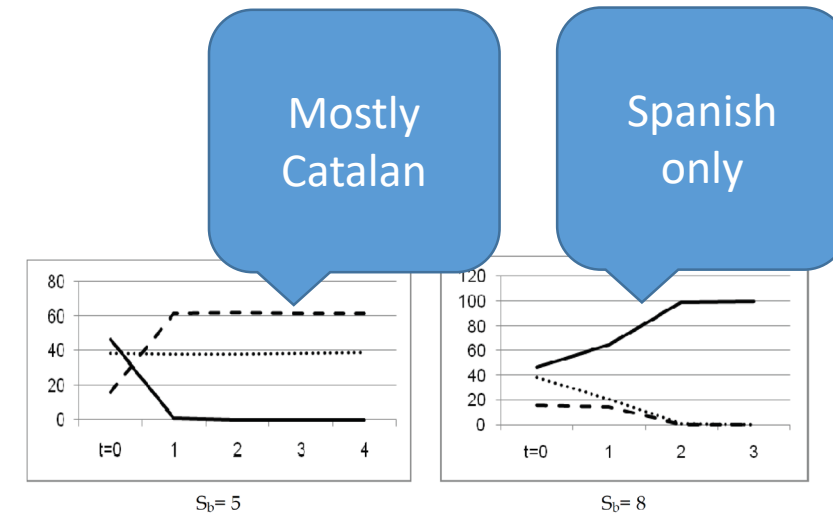

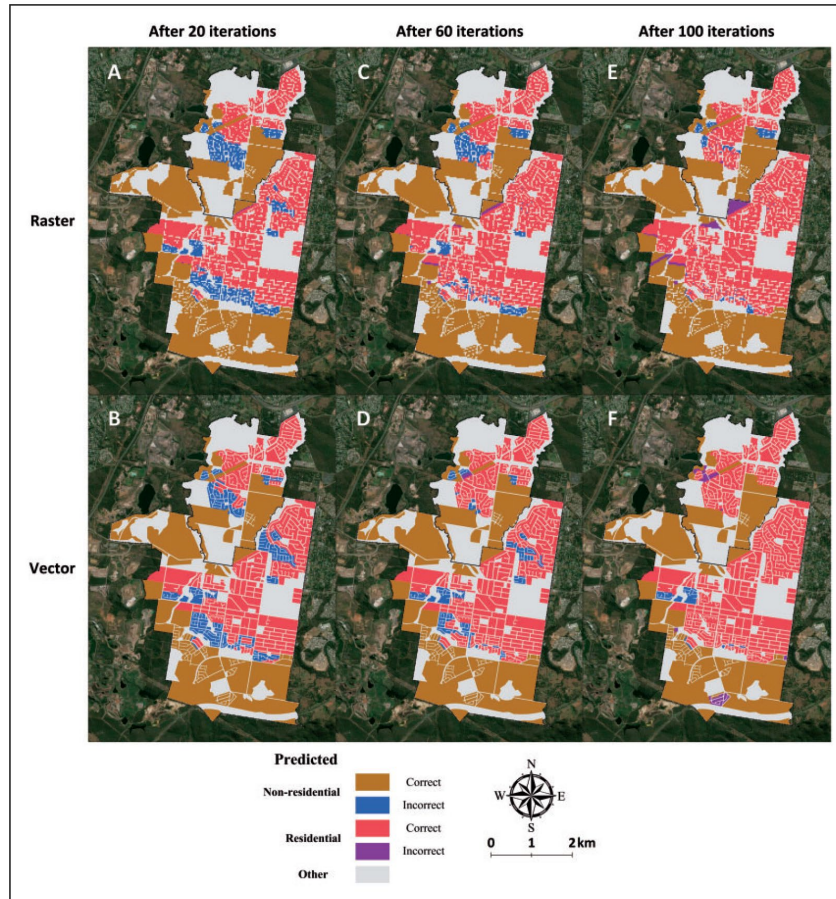

Fig. 6. Mean percentages of states 0 (solid), 1 (dashed) and 2 (dotted) for the values of threshold S_b when the automaton stabilized (values of $S_b = 4$ to 9) for the social context *home*. The x-axis indicates the generations of speakers. The percentage of initial values ($t=0$) is also shown. (Note that for the values $S_b = 8$ and $S_b = 9$, state 2 quickly reaches value 0).

Paper: Lu, Y., Laffan, S., Pettit, C., & Cao, M. (2020). Land use change simulation and analysis using a vector cellular automata (CA) model: A case study of Ipswich City, Queensland, Australia. *Environment and Planning B: Urban Analytics and City Science*, 47(9), 1605-1621.

Conclusions: vector CA is more accurate than grid CA

Paper: Ding, N., Chen, T., & Zhang, H. (2017, June). Simulation of high-rise building evacuation considering fatigue factor based on cellular automata: A case study in China. In Building Simulation (Vol. 10, No. 3, pp. 407-418). Tsinghua University Press.

Fig. 1 Grid map and six zones

(a) Cumulative number of evacuees between floors 7 and 5

Fig. 12 Drill and simulation data between floors 7 and 5

Conclusions: the simulation matches real the data from drill, fatigue can be modelled

Models of social behavior: details from the papers

topic	tool	neighbourhood	grid	states	rule
Language shift (Catalan language)	Excel	3×3 Moore	105x64 torus	Level of engagement (DL only/ bi DL++/ bi SL++)	totalistic rule with thresholds
Land use change (Ipswich City, Australia)	Matlab → ArcObjects	5×5 Moore	≈25000 land cells	Residential/non-residential (+distances to roads and services)	trained neural net
Building evacuation (Beijing, China)	Matlab → SPSS	3×3 Moore	15 floors of 84 cells staircases	#persons, fatigue level	probabilistic get-out/avoid-others

What else can ID do with CA besides predictive models?

- Educate young people to see the beauty of generated patterns
 - ✓ Lucas Haude's CA plotting machine:
 - ✓ research.tue.nl/en/publications/creating-an-interaction-with-cellular-automata-for-science-and-te
- Visualise the complexities of the fashion system
 - ✓ Troy Nachtigall's approach:
 - ✓ "The Life of Fashion Trends"
 - ✓ <https://thelifeoffashiontrends.wordpress.com/howto/>
- Support the complexity-science community via fashion
 - ✓ A cellular automaton for pied-de-poule:
 - ✓ Feijs, L., & Toeters, M. (2018). *International Journal of Design*, 12(3), 127-144.

CASE STUDY 1

- Educate / stimulate young people to play with generating patterns
 - ✓ Lukas Haude's machine
 - ✓ Haude, L. (2018, January). Creating an interaction with cellular automata for science and technology museums. In *17th Conference on Applied Mathematics (APLIMAT 2018)* (pp. 420-433). Slovak University of Technology in Bratislava.
 - ✓ http://www.lhau.de/assets/m22_interaction_cellularautomata_01.pdf

- ✓ Maker Fair Eindhoven September 2017
- ✓ Dutch Design Week 2017
- ✓ International Conference on Applied Mathematics Bratislava
- ✓ InScience International Science Film Festival Nijmegen
- ✓ De Ontdekkfabriek Eindhoven

CASE STUDY 2

- Visualise the complexities of the fashion system
 - ✓ Troy Nachtigall's approach:
 - ✓ The Life of Fashion Trends
 - ✓ <https://thelifeoffashiontrends.wordpress.com/howto/>

Step one :

Uri Wilensky: Life Turtle-Based – Netlogo.nlogo

- Patches: in a grid, to model the cellular structure

One variable for each patch: `live-neighbors`

- Two breeds of Turtles:

`cells`

`babies`

The `sprout` procedure is used to create a baby in the present patch

Neither `cells` nor `babies` actually move

- During each go several things happen

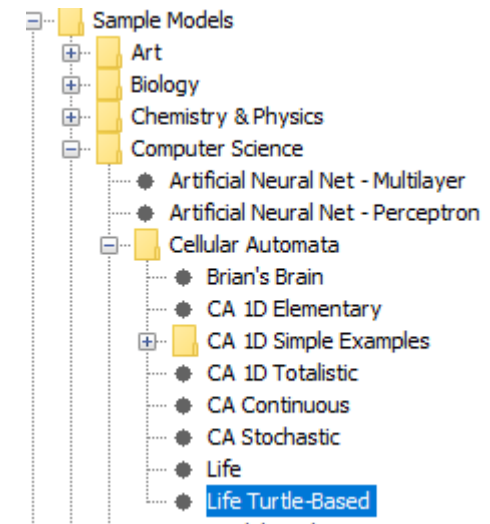

The `babies` change breed to become a live cell

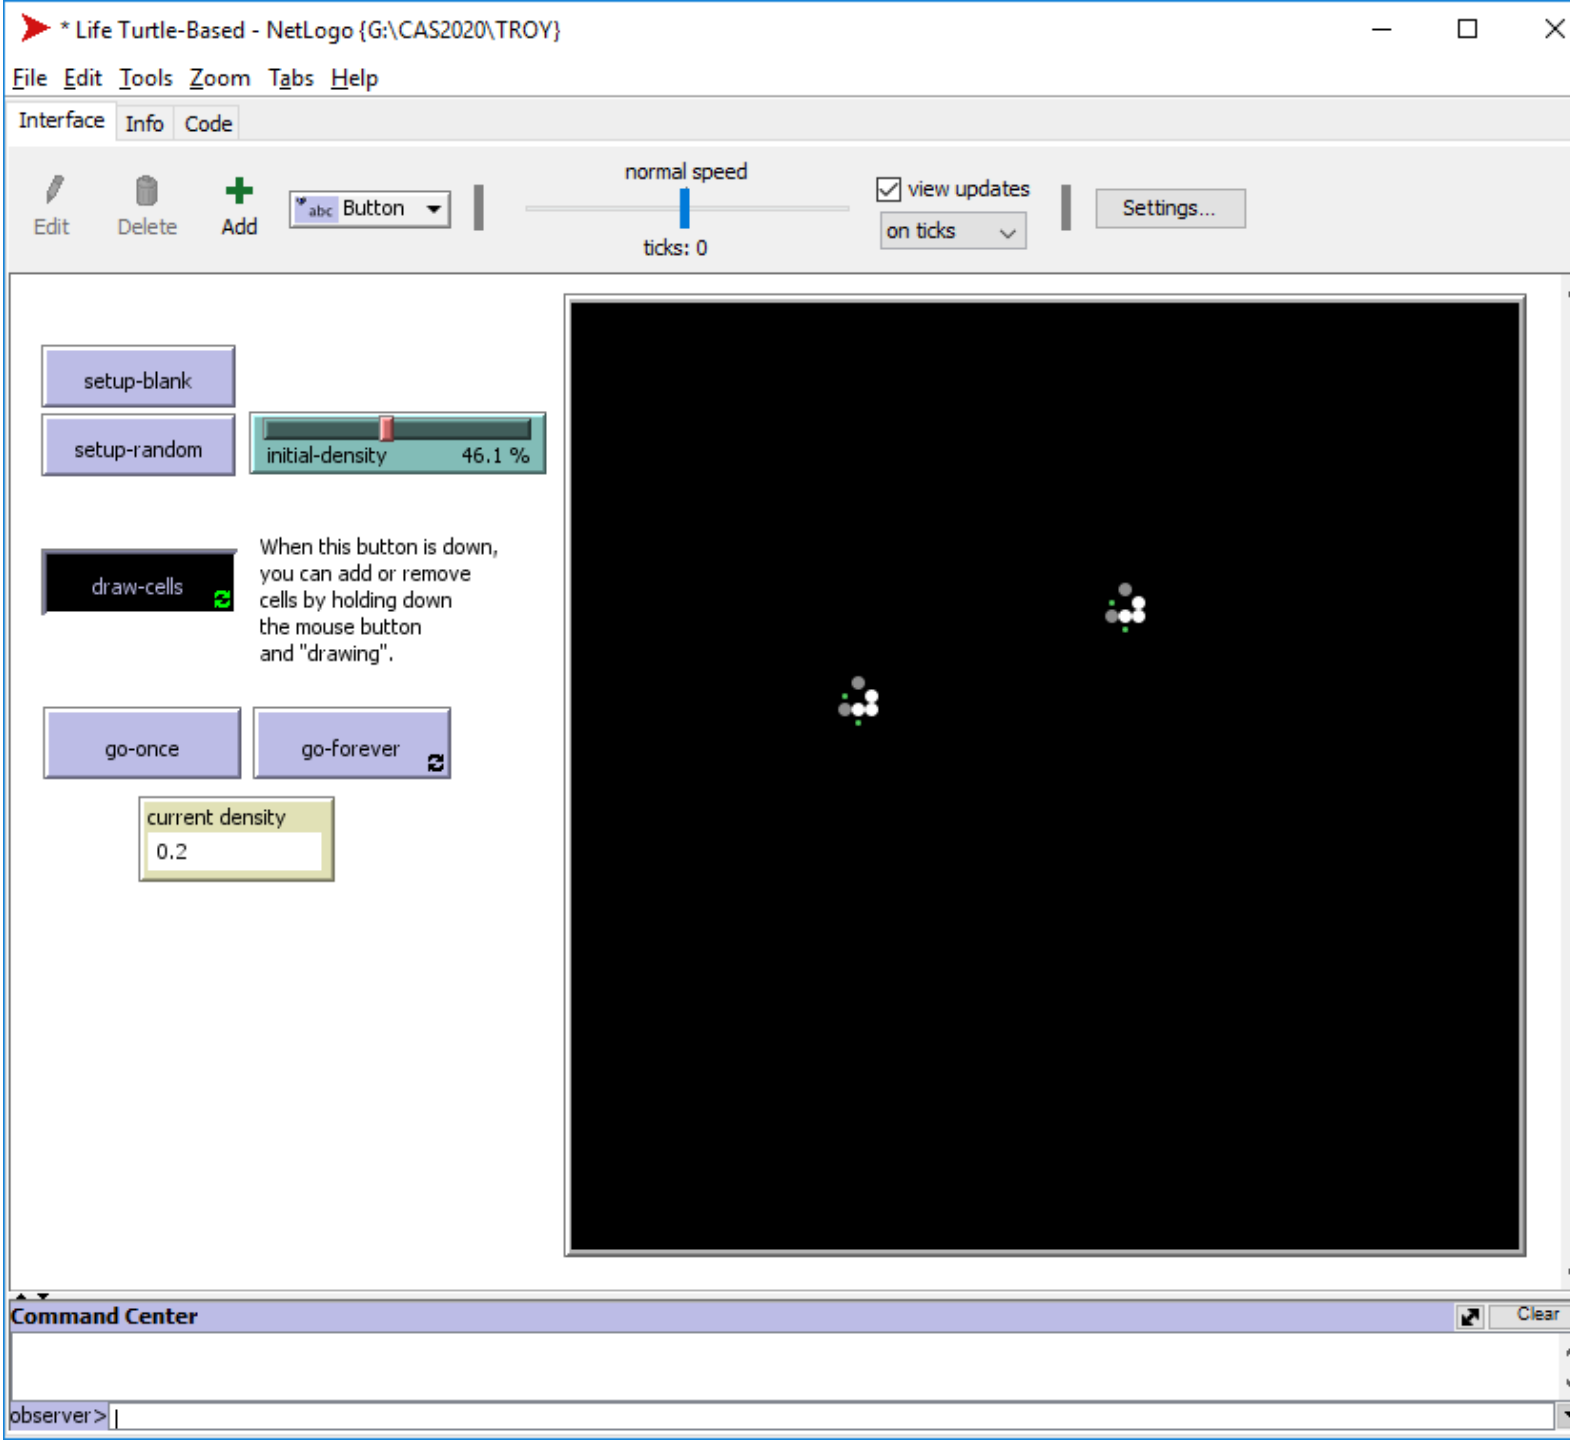

Gray `cells` die

The `cells` about to die become gray

Update the `live-neighbors` of each cell

And apply the famous rule of Conway's Game of Life

Step two :

Troy Nachtigall: The Life of Fashion Trends

- Patches: in a grid, to model the cellular structure
As before
- Three extra breeds of Turtles:
 - oldcells
 - eternals
 - stucks
- During each go several things happen
 - The oldcells stay visible for 52 steps
 - The babies get the trendcolor
 - The eternal's inflate other's live-neighbors
 - The stucks decrease live-neighbors
 - In the user interface these are "hotspots" and "notspots"

The Life of Fashion Trends

Speculating on how fashion trends happen using Complex Adaptive Systems

HOME · **ABOUT FASHION** · HOW IT WORKS · SIMULATION

- ✓ Style as an oscillator
- ✓ Style as a social phenomenon
- ✓ Fashion trend shuttles
- ✓ Symmetry – The Big Trend
- ✓ Inspiration

The Executive Board of the Amsterdam University of Applied Science (AUAS - Hogeschool van Amsterdam) has appointed Troy Nachtigall on 4 February 2020 as Professor of Fashion Research and Technology. The professorship is part of the Center for Applied Research (Create-IT) at the Faculty of Digital Media & Creative Industries (FDMCI) and is closely aligned with the Amsterdam Fashion Institute (AMFI). Nachtigall has a solid career in design and his research is often very innovative. Within the professorship, he will further strengthen the link between education and research.

CASE STUDY 3

- Support the complexity-science community via fashion
 - ✓ A cellular automaton for pied-de-poule
 - ✓ Feijs, L., & Toeters, M. (2018). Cellular automata-based generative design of Pied-de-poule patterns using emergent behavior: Case study of how fashion pieces can help to understand modern complexity. *International Journal of Design*, 12(3), 127-144.

So:

What else can ID do with CA(S) besides predictive models?

Loe's tentative answer:

- Generate awareness of emergent behavior and chaos phenomena
- Develop new and rich visual and interactive perspectives

www.youtube.com/watch?v=IK7nBOLYzdE
