- **Analog Output**

Why Arduino?

- **Physical Computing**
 - interfaces to sensors / actuators
 - prototypes behavior
 - entry level for designers and artists.
- **Tinkering**
- **Large community**
 - Blog, Forum, Playground (wiki)

Hardware

Arduino Uno

Arduino LilyPad

Arduino Ethernet

Arduino Nano

Arduino BT

Arduino Mini

Arduino Mega 2560

Arduino Fio

Arduino BT

Arduino Mini

USB/Serial Light Adapter

Arduino Pro Mini

Arduino Mega ADK

Arduino Pro

USB/Serial Light Adapter

Arduino Pro Mini

UNO

UNO

Microcontroller	ATmega328
Operating Voltage	5V
Input Voltage (VIN) (recommended)	7-12V
Input Voltage (limits)	6-20V
Digital I/O Pins	14 (of which 6 provide PWM output)
Analog Input Pins	6
DC Current per I/O Pin	40 mA
DC Current for 3.3V Pin	50 mA
Flash Memory	32 KB (ATmega328) of which 0.5 KB used by bootloader
SRAM (Static RAM)	2 KB (ATmega328)
EEPROM (Electrically erasable programmable ROM)	1 KB (ATmega328)
Clock Speed	16 MHz

UNO

- Power: USB Power supply (5V)

UNO

- Power: external power supply (7V-12V)

UNO

- Power: VIN, depends on external source. (7-12V)

UNO

- Power: 5V supply

UNO

- Power: 3.3V supply

UNO

- Power: GND pins

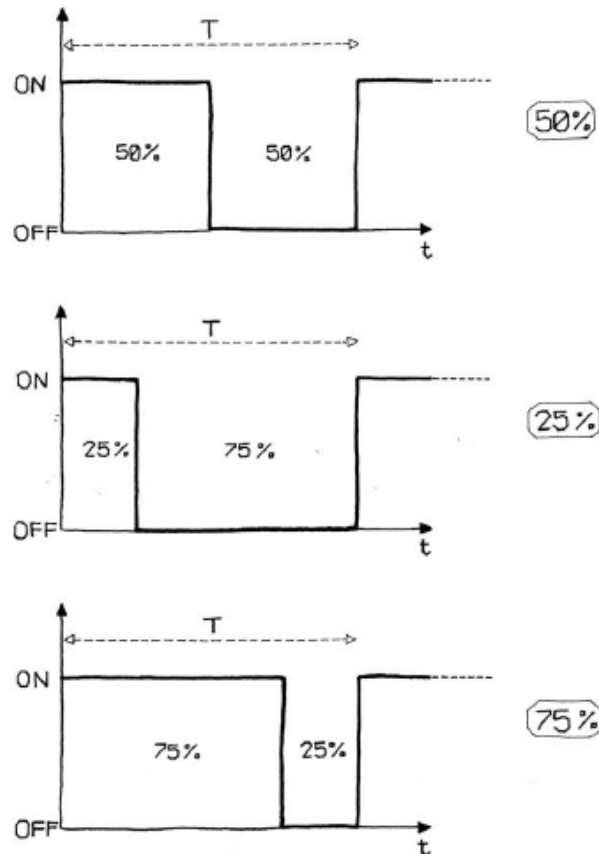

UNO

- Digital I/O Pins 14 (of which 6 provide PWM output)

UNO

- Digital I/O Pins 14 (6 Pulse Width Modulation output)

UNO

- Serial: 0 (RX) and 1 (TX)

UNO

- LED: 13

UNO

- 6 analog inputs, 10 bits resolution (1024 values)

UNO

- **AREF:** Reference voltage for the analog inputs

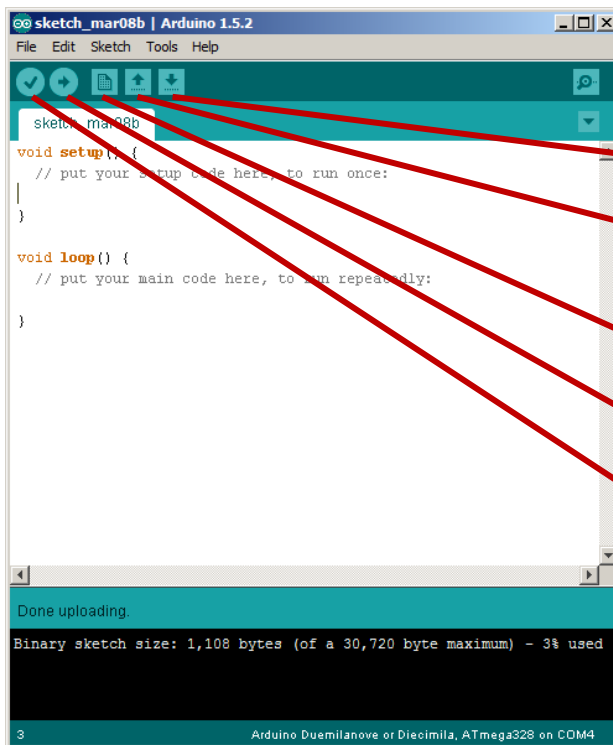

UNO

- **Reset. LOW to reset the microcontroller**

Software: IDE

- <http://arduino.cc/en/Main/Software>

Save Sketch

Open Sketch
(old: *.pde, new: *.ino)

New Sketch

Compile and Upload

Verify (Compile)

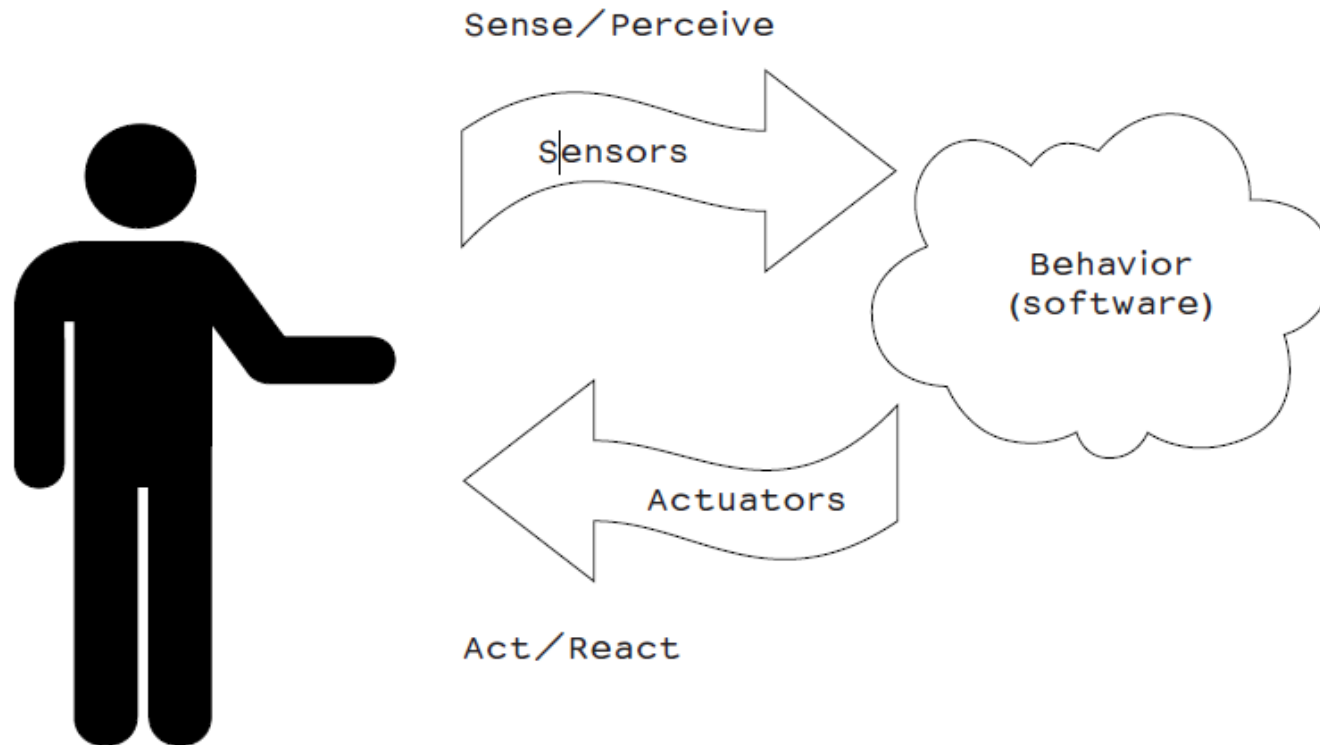

Driver Installation and Port Identification

- Refer to the instructions in
 - “Getting Started with Arduino” book, page 23-26
 - <http://arduino.cc/en/Guide/HomePage>

Breadboard

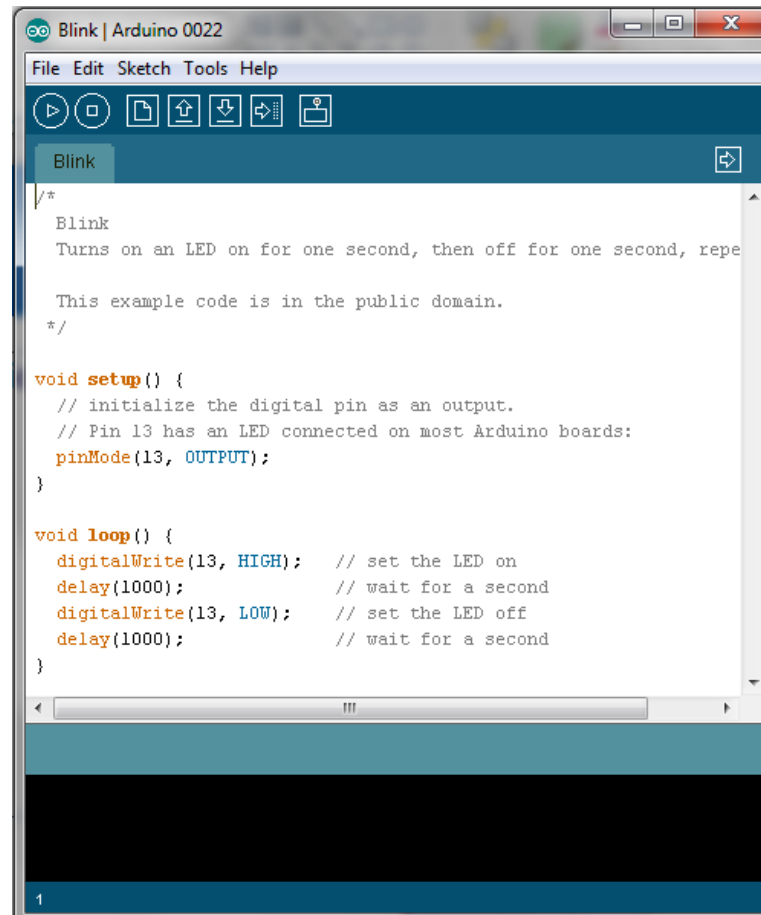

Really getting started

Blinking a LED

- **File>Examples>Basics>Blink**
- **LED: light-emitting diode**

A screenshot of the Arduino IDE window titled "Blink | Arduino 0022". The window has a menu bar with "File", "Edit", "Sketch", "Tools", and "Help". Below the menu bar is a toolbar with icons for running, saving, opening, and other functions. The main text area shows the "Blink" example code. The code is as follows:

```
/*  
  Blink  
  Turns on an LED on for one second, then off for one second, repe  
  
  This example code is in the public domain.  
  */  
  
void setup() {  
  // initialize the digital pin as an output.  
  // Pin 13 has an LED connected on most Arduino boards:  
  pinMode(13, OUTPUT);  
}  
  
void loop() {  
  digitalWrite(13, HIGH); // set the LED on  
  delay(1000);             // wait for a second  
  digitalWrite(13, LOW);  // set the LED off  
  delay(1000);             // wait for a second  
}
```

Blinking a LED

Blinking a LED

- **#define LED 13**

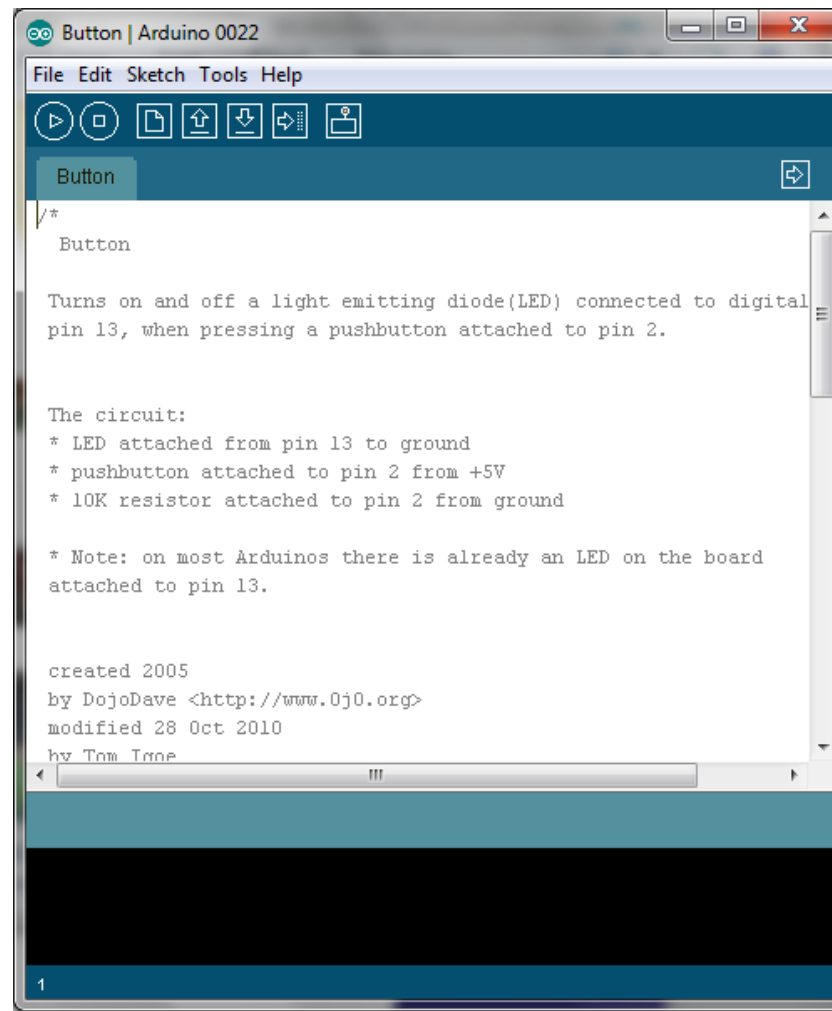

```
#define LED 13

void setup() {
    // initialize the digital pin as an output.
    // Pin 13 has an LED connected on most Arduino boards:
    pinMode(LED, OUTPUT);
}

void loop() {
    digitalWrite(LED, HIGH);    // set the LED on
    delay(1000);                // wait for a second
    digitalWrite(LED, LOW);     // set the LED off
    delay(1000);                // wait for a second
}
```

Button to control a LED

- **File>Examples>Digital>Button**

Button to control a LED

Button to control a LED

```
// constants won't change. They're used here to
// set pin numbers:
const int buttonPin = 2;    // the number of the pushbutton pin
const int ledPin = 13;     // the number of the LED pin

// variables will change:
int buttonState = 0;        // variable for reading the pushbutton status

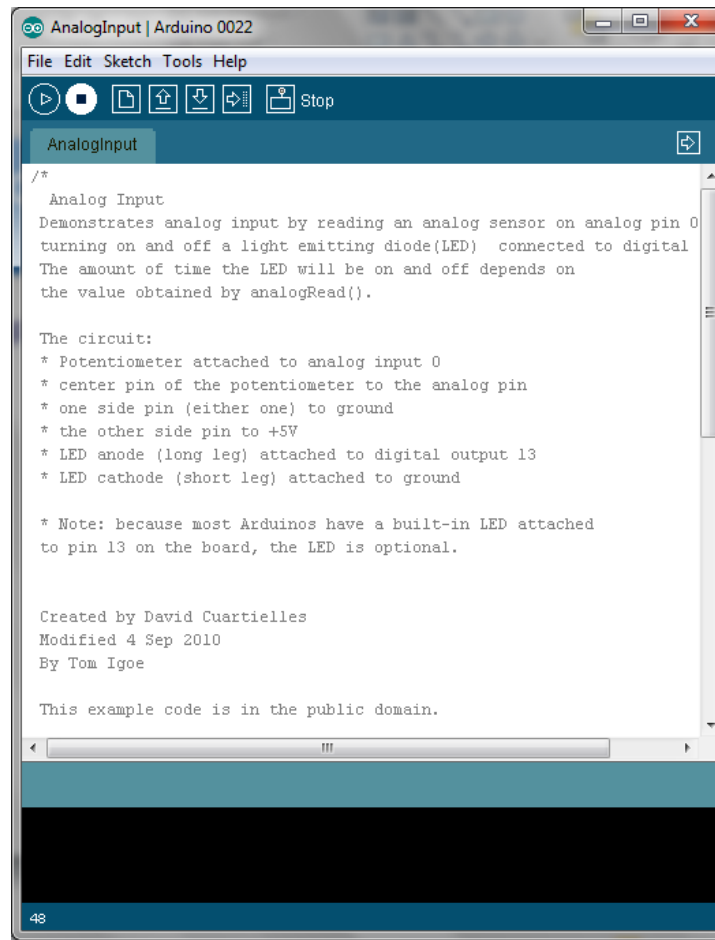

void setup() {
  // initialize the LED pin as an output:
  pinMode(ledPin, OUTPUT);
  // initialize the pushbutton pin as an input:
  pinMode(buttonPin, INPUT);
}
```

Button to control a LED

```
void loop(){  
  // read the state of the pushbutton value:  
  buttonState = digitalRead(buttonPin);  
  
  // check if the pushbutton is pressed.  
  // if it is, the buttonState is HIGH:  
  if (buttonState == HIGH) {  
    // turn LED on:  
    digitalWrite(ledPin, HIGH);  
  }  
  else {  
    // turn LED off:  
    digitalWrite(ledPin, LOW);  
  }  
}
```

Analog I/O

- **File>Examples>Analog>AnalogInput**
 - Instead of a potentiometer, we use a light sensor

Analog I/O

Analog Input

```
int sensorPin = A0;    // select the input pin for the potentiometer
int ledPin = 13;       // select the pin for the LED
int sensorValue = 0;   // variable to store the value coming from the sensor

void setup() {
    // declare the ledPin as an OUTPUT:
    pinMode(ledPin, OUTPUT);
}

void loop() {
    // read the value from the sensor:
    sensorValue = analogRead(sensorPin);
    // turn the ledPin on
    digitalWrite(ledPin, HIGH);
    // stop the program for <sensorValue> milliseconds:
    delay(sensorValue);
    // turn the ledPin off:
    digitalWrite(ledPin, LOW);
    // stop the program for for <sensorValue> milliseconds:
    delay(sensorValue);
}
```

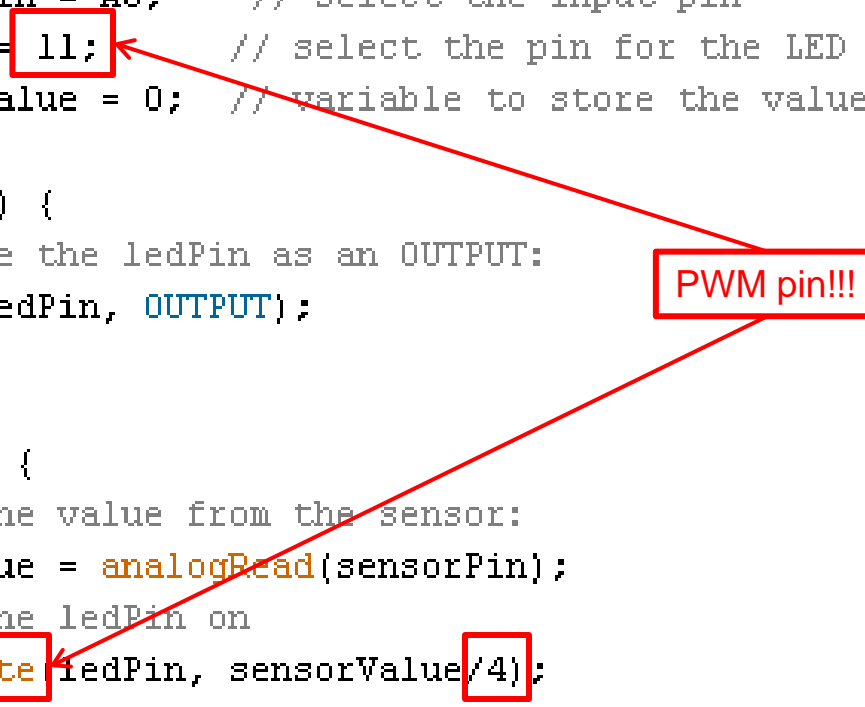

Analog I/O

```
int sensorPin = A0;    // select the input pin
int ledPin = 11;       // select the pin for the LED
int sensorValue = 0;   // variable to store the value coming from the sensor

void setup() {
    // declare the ledPin as an OUTPUT:
    pinMode(ledPin, OUTPUT);
}

void loop() {
    // read the value from the sensor:
    sensorValue = analogRead(sensorPin);
    // turn the ledPin on
    analogWrite(ledPin, sensorValue/4);
}
```

PWM pin!!!

Serial Communication

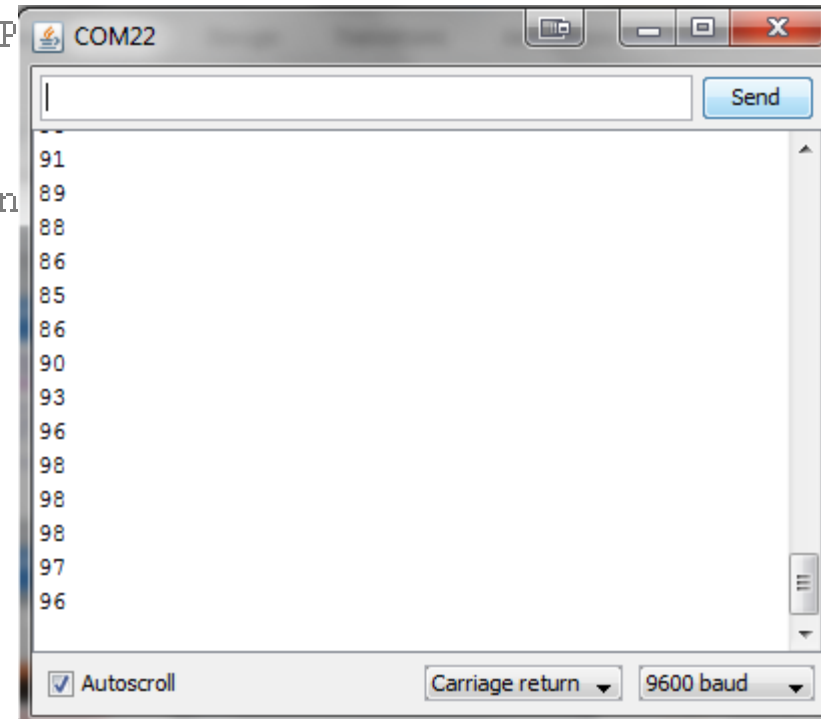

```
// Example 11-06 from "Getting Started with P
// by Reas & Fry. O'Reilly / Make 2010

// Note: This is code for an Arduino board, n

int sensorPin = 0; // Select input pin
int val = 0;

void setup() {
  Serial.begin(9600); // Open serial port
}

void loop() {
  val = analogRead(sensorPin) / 4; // Read value from sensor
  Serial.println(val); // Print variable to serial port
  delay(100); // Wait 100 milliseconds
}
```

Serial communication

- **Allows Arduino to communicate**
 - **Directly**
 - via USB cable / COM port
 - **Wireless**
 - via WiFi module
 - via Xbee
 - via bluetooth module

Examples

- **Bad code / Good code**

- **Arduino communicating to notebook**

That was Arduino.
